## CLAIMS

1. (Currently Amended) A method of transferring at least two data streams in a medical device, comprising:
  - collecting first data stream data into a first intermediate register;
  - collecting additional data stream data into at least one additional intermediate register; and
  - storing first intermediate register contents in a first output register;  
storing first intermediate register contents in at least one additional output register; and  
storing remaining first intermediate register contents in the first intermediate register if the additional output register is full.
2. (Original) The method of claim 1, further comprising:  
storing additional intermediate register contents in the first output register.
3. (Cancelled)
4. (Cancelled)
5. (Original) The method of claim 1 further comprising:  
storing additional intermediate register contents in at least one additional output register.
6. (Original) The method of claim 5 further comprising:  
storing remaining additional intermediate register contents in the additional intermediate register if the additional output register is full.

Applicants: Augustijn et al.  
Serial No. 09/843,915  
Page 3

7. (Original) The method of claim 1 further comprising:  
storing first intermediate register contents with an identification code that uniquely identifies the first data stream data.
8. (Original) The method of claim 1 further comprising:  
storing additional intermediate register contents with an identification code that uniquely identifies the additional data stream data.
9. (Original) The method of claim 1 further comprising:  
transferring contents of the first output register to memory.
10. (Original) The method of claim 9 further comprising:  
transferring contents of an additional output register to memory.
11. (Original) The method of claim 1 further comprising:  
receiving compressed first data stream data.
12. (Original) The method of claim 1 further comprising:  
receiving compressed additional data stream data.
13. (Original) The method of claim 1 further comprising:  
collecting first data stream data until the first intermediate register is full.
14. (Original) The method of claim 1 further comprising:  
collecting additional data stream data until the additional intermediate register is full.
15. (Original) The method of claim 1 further comprising:  
storing remaining first intermediate register contents in the first intermediate register if the first output register is full.

Applicants: Augustijn et al.  
Serial No. 09/843,915  
Page 4

16. (Original) The method of claim 1 further comprising:  
~~storing remaining additional intermediate register contents in the additional intermediate register if the first output register is full.~~
17. (Cancelled)
18. (Currently Amended) A method of transferring at least two data streams in a medical device, comprising:  
~~collecting first data stream data into a first intermediate register;~~  
~~collecting additional data stream data into at least one additional intermediate register;~~  
~~storing first intermediate register contents in a first output register; and~~  
~~The method of claim 17 wherein the first intermediate register is full, further comprising:~~  
~~storing first intermediate register contents in the first output register if the state of the first output register is empty, when the first intermediate register is full.-~~
19. (Original) The method of claim 18 further comprising:  
~~storing first intermediate register contents in the additional output register if the state of the first output register is full.~~
20. (Currently Amended) The method of claim 17-18 wherein the additional intermediate register is full, further comprising:  
~~storing additional intermediate register contents in the first output register if the state of the first output register is empty.~~
21. (Original) The method of claim 20 further comprising:  
~~storing additional intermediate register contents in the additional output register if the state of the first output register is full.~~

## 22.-31. (Cancelled)

32. (Currently Amended) A system for transferring at least two data streams in a medical device, comprising:

means for collecting first data stream data into a first intermediate register;  
means for collecting additional data stream data into at least one additional intermediate register; and  
means for storing first intermediate register contents in a first output register;

means for storing first intermediate register contents in at least one additional output register; and

means for storing remaining first intermediate register contents in the first intermediate register if the additional output register is full.-

33. (Original) The system of claim 32, further comprising:

means for storing additional intermediate register contents in the first output register.

34. (Cancelled)

35. (Cancelled)

36. (Currently Amended) A system for transferring at least two data streams in a medical device, comprising:

means for collecting first data stream data into a first intermediate register;  
means for collecting additional data stream data into at least one additional intermediate register;  
means for storing first intermediate register contents in a first output register; The system of claim 32, further comprising:

Applicants: Augustijn et al.  
Serial No. 09/843,915  
Page 6

means for storing additional intermediate register contents in at least one additional output register; and

means for storing remaining additional intermediate register contents in the additional intermediate register if the additional output register is full.

37. (Cancelled)

38. (Original) The system of claim 32, further comprising:

means for storing first intermediate register contents with an identification code that uniquely identifies the first data stream data.

39. (Original) The system of claim 32, further comprising:

means for storing additional intermediate register contents with an identification code that uniquely identifies the additional data stream data.

40. (Original) The system of claim 32, further comprising:

means for transferring contents of the first output register to memory.

41. (Original) The system of claim 40, further comprising:

means for transferring contents of an additional output register to memory.

42. (Original) The system of claim 32, further comprising:

means for collecting first data stream data until the first intermediate register is full.

43. (Original) The system of claim 32, further comprising:

means for collecting additional data stream data until the additional intermediate register is full.

Applicants: Augustijn et al.  
Serial No. 09/843,915  
Page 7

44. (Original) The system of claim 32, further comprising:  
means for storing remaining first intermediate register contents in the first intermediate register if the first output register is full.
45. (Original) The system of claim 32, further comprising:  
means for storing remaining additional intermediate register contents in the additional intermediate register if the first output register is full.
46. (Original) The system of claim 32, further comprising:  
means for determining a state of the first output register.
47. (Currently Amended) A computer usable medium including a program for transferring data in an implantable device, comprising:  
computer program code that collects first data stream data into a first intermediate register;  
computer program code that collects additional data stream data into at least one additional intermediate register; and  
computer program code that stores first intermediate register contents in a first output register;  
computer program code that stores first intermediate register contents in at least one additional output register; and  
computer program code that stores remaining first intermediate register contents in the first intermediate register if the additional output register is full.
48. (Original) The program of claim 47, further comprising:  
computer program code that stores additional intermediate register contents in the first output register.
49. – 50. (Cancelled)

Applicants: Augustijn et al.

Serial No. 09/843,915

Page 8

51. (Original) The program of claim 47 further comprising:  
computer program code that stores additional intermediate register contents in at least one additional output register.
52. (Original) The program of claim 51 further comprising:  
computer program code that stores remaining additional intermediate register contents in the additional intermediate register if the additional output register is full.
53. (Original) The program of claim 47 further comprising:  
computer program code that stores first intermediate register contents with an identification code that uniquely identifies the first data stream data.
54. (Original) The program of claim 47 further comprising:  
computer program code that stores additional intermediate register contents with an identification code that uniquely identifies the additional data stream data.
55. (Original) The program of claim 47 further comprising:  
computer program code that transfers contents of the first output register to memory.
56. (Original) The program of claim 55 further comprising:  
computer program code that transfers contents of an additional output register to memory.
57. (Original) The program of claim 47 further comprising:  
computer program code that receives compressed first data stream data.

Applicants: Augustijn et al.  
Serial No. 09/843,915  
Page 9

58. (Original) The program of claim 47 further comprising:  
computer program code that receives compressed additional data stream data.
59. (Original) The program of claim 47 further comprising:  
computer program code that collects first data stream data until the first intermediate register is full.
60. (Original) The program of claim 47 further comprising:  
computer program code that collects additional data stream data until the additional intermediate register is full.
61. (Original) The program of claim 47 further comprising:  
computer program code that stores remaining first intermediate register contents in the first intermediate register if the first output register is full.
62. (Original) The program of claim 47 further comprising:  
computer program code that stores remaining additional intermediate register contents in the additional intermediate register if the first output register is full.
63. (Original) The program of claim 47 further comprising:  
computer program code that determines a state of the first output register.
64. (Original) The program of claim 63 wherein the first intermediate register is full, further comprising:  
computer program code that stores first intermediate register contents in the first output register if the state of the first output register is empty.

Applicants: Augustijn et al.  
Serial No. 09/843,915  
Page 10

65. (Original) The program of claim 64 further comprising:  
computer program code that stores first intermediate register contents in  
the additional output register if the state of the first output register is full.
66. (Original) The program of claim 63 wherein the additional intermediate  
register is full, further comprising:  
computer program code that stores additional intermediate register  
contents in the first output register if the state of the first output register is empty.
67. (Original) The program of claim 66 further comprising:  
computer program code that stores additional intermediate register contents in  
the additional output register if the state of the first output register is full.
